Real Estate Lead Processing & Automation Platform

Features, integrated components and complete operating workflows

Prepared for David D. McElroy
David D. McElroy Real Estate | Dallas-Fort Worth

The platform receives and organizes inquiries, preserves contact and consent records, coordinates responses and educational follow-up, supports consented conversations, tracks appointments, and records operational outcomes.

Its product is lead processing and automation. Advertising, referrals, organic content and other acquisition channels supply the people who enter it. Automated processing does not establish that traffic, qualified leads, appointments or revenue will be generated.

What this document covers

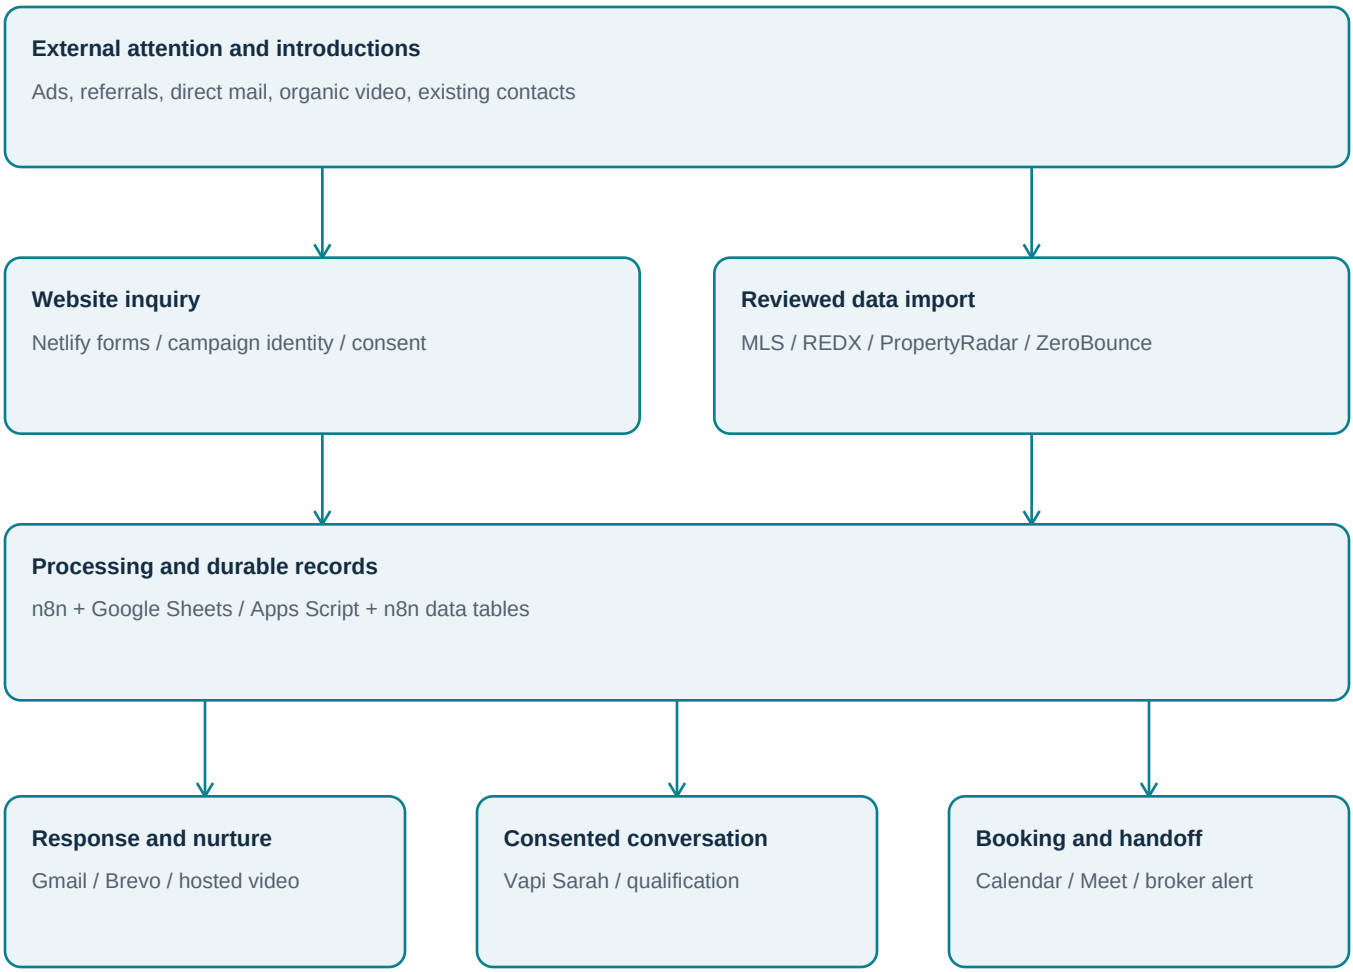

Architecture and service roles; feature catalog; intake, data preparation, email, voice, booking, media and reporting workflows; campaign differences; data handoffs; current operational status; and a technical workflow register.

How to read status

Label	Meaning
Configured / active	The live workflow is enabled or its nodes exist. This is not proof of a complete successful customer journey.
Recorded evidence	A saved description or prior receipt reports a specific result. It is labeled separately from a fresh test.
Staged / held	Built or prepared, with a disabled trigger, dispatch gate or unresolved dependency.
External / manual	An input, business decision or activity outside the verified automated path.

Snapshot: November 17, 2026, approximately 4:35 p.m. Central. Read-only documentation review; no test leads, calls, emails or bookings were initiated for this report.

How the components fit together

Shared services across every branch

Identity matching, consent, suppression, duplicate prevention, action reservations, provider receipts, recovery queues, operational monitoring and owner reporting accompany the processing path. Website and video assets support communication; they do not replace these records.

The business handoff

The desired output is a traceable, qualified inquiry and a confirmed appointment or requested response for David. Consultation, representation decisions, listing agreements, negotiation and closing remain broker-led activities. No automated contract-to-close or commission-accounting integration was established in this review.

Services and their responsibilities

Component	Role and handoff	Evidence / scope
n8n Cloud	Webhooks, schedules, conditional routing, API requests, child workflows and failure handling.	Live workflow definitions reviewed.
Google Sheets + Apps Script	Canonical lead and activity records; intake queue processing; consent, action history and seller pipeline.	Live read/write nodes and processor route.
n8n data tables	Durable enrollment, claims, allowances, stops, media jobs, booking state and recovery.	36 tables enumerated.
Netlify	Campaign websites, forms, serverless processing, watch pages, video/thumbnail hosting and deployment.	Configured routes and saved deployment evidence; not every site retested.
Google Workspace / Gmail	Prospect confirmations, permitted follow-up, replies and mailbox monitoring.	API transport and monitoring configured. Acceptance differs from delivery.
Brevo	Authorized tests and subscriber/confirmation infrastructure; delivery-event reporting.	DOI and stop automation still contains held paths.
Vapi / Sarah	Consent-based voice follow-up, structured qualification and callbacks.	Relist and FSBO paths configured; FSBO callback evidence recorded.
Google Calendar / Meet	Appointments, changes/cancellations, event matching and owner notices.	Active monitors; complete journey not freshly tested.
HeyGen	Personalized video and approved David voice/avatar assets.	Generation, status and hosting workers; job IDs reused.
OpenAI / ChatGPT / Dot	Supervision, bounded analysis, preparation, operating tasks and usage tracking.	AI router and scheduled coordinator configured.
Gemini	Cited property or city research and reviewed report preparation.	City research configured; several report delivery chains held.
YouTube + vidIQ	Video publishing support, packaging research and performance analysis.	Queue and coordinator exist; individual release must be verified.
Namecheap SMTP	Independent owner operational alerts.	Action-alert workflow records acceptance/rejection/unknown.
MLS / REDX / PropertyRadar / ZeroBounce	Source records, owner/contact enrichment and mailbox checks.	Data-preparation inputs; not proof of interest or consent.

What the platform is built to do

Feature family	Included capabilities
Intake and attribution	Campaign-specific forms; contact/property normalization; submission identity; source and UTM attribution; durable capture; acknowledgment; recovery of saved form records.
Lead organization	Canonical lead IDs; owner/property associations; campaign routing; reviewed enrollment; seller pipeline; batch and action history; appointment status.
Consent and contact preferences	Separate series opt-in and call consent; saved consent evidence; stop requests; bounce and unsubscribe handling; cross-campaign suppression; no-consent manual paths.
Data preparation	MLS/REDX imports; PropertyRadar enrichment; individual/entity review; geography, property and listing checks; ZeroBounce evidence; duplicate handling; source provenance.
Follow-up communications	Requested confirmation and response; reusable introductions and video series; saved sequence position; spacing; daily/hourly windows; deferred requests; city-specific footer links.
Personalized presentation	Property-specific scripts and videos; approved avatar/voice; thumbnails; branded watch pages; hosted assets; captions and share-preview artwork.
Voice qualification	Sarah consent gate; stable call identity; call reservations; qualification callback capture; stop requests; booking guidance.
Appointments and owner handoff	Calendar event matching; created/updated/cancelled events; appointment ledger; owner alerts; reconciliation; seller task updates.
Research and education	City Insider content; educational video libraries; property report/audio preparation; version review and approval before delivery in staged report chains.
Operational control	Atomic reservations; worker leases; duplicate prevention; saved receipts; bounded recovery; critical alerts; health checkpoints; daily reporting; AI and media resource budgets.
Measurement	Provider acceptance; selected receiving-server delivery events; open/click signals; replies; submissions; bookings; video analytics; diagnostic tests excluded from prospect metrics.

From an interested person to a recorded inquiry

01 Person arrives at a campaign page

A referral, ad, postcard QR code, organic video or direct visit supplies the visitor. The page identifies the offer and records source information where implemented.

02 The person submits their request

The form collects contact and property details plus the relevant request. Email-series permission and permission for an automated call are distinct choices.

03 The submission is verified and saved

Netlify submission identity or the authenticated campaign route is checked. The workflow normalizes the fields, checks for an existing record, and stores the request and consent before downstream action.

04 The request is routed

Relist, FSBO, buyer and city inquiries use their configured routes. Seller Success receives supported seller inquiry events; staged foreclosure/investor paths must not be described as released.

05 Independent actions are reserved

Thank-you, owner notice, call and other actions have separate claim/outcome records in supported routes. Repeated webhooks should not create repeated messages or calls.

06 The appropriate response is attempted

The workflow applies the relevant address, suppression and account checks, sends the permitted response, and saves the provider outcome. A web success page or accepted send alone does not verify inbox receipt.

07 The broker receives a usable handoff

The intended handoff includes the person, property, request, source, consent, latest action and next task. Owner alert delivery and the reply path still require end-to-end proof for each live campaign.

Important branch: a one-time request authorizes its requested response; it does not automatically establish permission for an extended educational sequence or a Sarah call.

Imported records and contact preparation

01 Source and normalize

Receive the owner-provided MLS or REDX file. Retain source date, listing identity and property address. Use the supplied MLS address as authoritative when enrichment differs.

02 Enrich and associate

PropertyRadar adds candidate owner/contact details. Match the property and owner or co-owner; retain conflicting or uncertain identity information for review.

03 Apply campaign eligibility

Review entity ownership, service area, property type, price/listing rules and existing suppression according to the current authorized campaign. Daily MLS uploads supply the owner-provided latest listing status; concrete newer conflicts are handled separately.

04 Verify mailbox quality

ZeroBounce evaluates the candidate mailbox. Validity does not prove current ownership, that the mailbox is read, marketing consent, inbox placement or interest.

05 Persist the reviewed subset

Save batch evidence, email-quality decisions, canonical identity and reviewed enrollment. Preserve prior records, holds, receipts and sequence history.

06 Route only authorized work

Requested opt-in follow-up uses the appropriate sequence. The November 17 personalized-invitation exception is a separate bounded operating mode; importing data is not itself an instruction to send.

Current operational distinction

Broad cold-email programs were discontinued. The live November 17 configuration subsequently records a narrow restart for the personalized Relist invitation, including a specifically approved new subset. That exception does not restart the full prospect sequence, FSBO or foreclosure outbound. This report documents that configuration without expanding it.

Email response, nurture and feedback

01 Choose the correct message and recipient

Use the saved request, campaign, consent and sequence position. Relist retains three introductory messages and 23 video positions; the full test order is introductions, assets 02-23, then asset 01. FSBO retains a six-email series.

02 Check eligibility at dispatch

Recheck suppression, source authorization, contact quality, prior/uncertain outcomes and required spacing. Claim both the individual action and shared allowance where applicable.

03 Compose and send through the chosen route

Gmail is a configured production transport. Brevo is used for authorized tests and subscriber-related infrastructure. Hosted watch pages and thumbnails support video messages; the seller form link is distinct from a city-content link.

04 Record the actual result

Preserve provider message ID, timestamp, route, action identity and acceptance/rejection/unknown result. Reconcile an uncertain remote action before considering a retry.

05 Read the response signals

Mailbox workers classify replies, bounces and unsubscribe events. Engagement endpoints record tracked requests. Provider delivery events and open/click signals are separate measurements.

06 Update the lead and owner task

Stop inappropriate future messages, preserve the event, notify the owner where required and associate genuine requests with the lead. Ordinary authorized test replies follow the separate test policy.

Current setting	Documented scope
Sending window	6:00 a.m. to 8:00 p.m. America/Chicago for the updated active Relist sender.
Current Relist ceiling	131 shared per day, 129 Relist per day and 12 per hour in the narrow authorized configuration; these are ceilings, not delivery guarantees.
Spacing and tests	Existing 48-hour recipient spacing and 10-minute media pacing retained. David/Maritza test remains isolated with its own receipts.
Historical policy fields	Some legacy end_hour=18 values remain identity checks for prior capacity authorization; runtime time gates and schedule now close at 20:00.

Sarah, qualification and broker handoff

01 Read saved consent and identity

A call branch must match the persisted submission, phone, campaign and consent. Without call consent, retain the inquiry for its permitted email/manual response.

02 Reserve and initiate the call

The supported route claims the action, sends the Vapi request with the intended assistant, and records the provider call ID and result. A call request is not a completed conversation.

03 Capture qualification and stop requests

Sarah callbacks are matched to the saved lead and call. Stable event/tool IDs prevent duplicate writes. Stop-contact requests are retained and acted on through the relevant suppression path.

04 Guide the person to a confirmed appointment

Sarah provides the booking handoff. Do not equate an offered time or promised callback with a Calendar event. Confirm the event identity, time zone and attendees.

05 Reconcile the calendar

The shared monitor observes creation, updates and cancellations and performs ten-minute catch-up checks. It matches the event to supported campaign records and saves booking history.

06 Notify and prepare David

The owner-notification path claims its action and records its send result. Seller appointment tracking receives the event. David handles the consultation and subsequent brokerage work.

Configuration differences matter

FSBO call follow-up and its qualification callback are active, with a previously recorded callback verification. Relist has saved-consent and call-reservation nodes. Buyer Plan and Carrollton Insider have consent and no-consent branches. Investor call dispatch and foreclosure processing remain held in their separate workflows.

Verification limit: this review inspected configuration, not a fresh live caller-to-calendar-to-confirmation journey. Prior success in one branch is not proof that every campaign branch currently works.

The asset-production and education workflow

01 Prepare the approved content

Select the campaign, property or topic and saved script. Property-specific video work follows the authorized enrollment and media job; general education follows the content queue.

02 Reuse before generating

Look for existing HeyGen jobs and completed files. Reserve the authorized job, check resource limits, submit once, then poll the saved provider ID.

03 Verify and host

Check asset identity, duration and usable video/thumbnail files. Store on the campaign hosting route and associate the watch-page or media token with the correct record.

04 Package for the intended channel

Email uses hosted thumbnails/watch pages. Websites use working links and branded previews. Shorts require vertical media, captions, an appropriate thumbnail, accurate topic-specific title/description and a related video where available.

05 Publish and measure

The nightly coordinator uses the YouTube publishing queue; native daily publisher scheduling is disabled. Verify actual video ID and public/scheduled state separately. vidIQ supplies available private analytics and packaging research.

Reusable assets

Relist educational videos; six FSBO lessons; six foreclosure educational videos with introductory copy; seller education and Keep/Rent/Sell material; City Insider pages; narrated platform presentations; QR codes and social previews. Asset availability does not establish that its corresponding automated delivery chain is released.

Research and report delivery

City Insider uses Gemini research, source review and preserved-site preparation; automatic deployment is not established by the research workflow. FSBO and foreclosure post-consultation report chains are staged: completed consultation, saved research job, cited draft, owner approval of the exact version, audio, hosting and claimed delivery. These must remain labeled held until their dependencies and full path are verified.

Records that make processing traceable

Record family	What it preserves
Lead and seller records	Contact and property identity, source, campaign, request, consent, stage and next action in Sheets and supported backend records.
Intake and event journals	Submission identity, request details, opt-in state, received time, errors and provider receipts; immutable stop/event evidence where implemented.
Enrollment and email quality	Reviewed membership, batch identity, sequence position, prior outcomes, candidate-owner association and verification evidence.
Claims and allowances	Action reservations, execution identity, expiry, shared capacity, account policy and deferred requests.
Media and publishing state	Saved job IDs, asset identity, worker claims, video queue, release evidence and observation checkpoints.
Monitoring and recovery	Heartbeat timestamps, mailbox/booking checkpoints, incident status, original failure, attempted remedy and next action.
AI resource records	Task tiers, conditional budget reservations and actual usage ledger; advisory analysis does not grant permission for external action.

Cross-component contract

Every handoff should preserve a stable lead/submission identity, campaign, source reference, consent scope, action key, timestamp, outcome and external receipt when one exists. Google Sheets and n8n tables have different responsibilities; their existence alone does not mean every record is synchronized.

Failure handling

Read the durable claim and provider outcome before retrying. Retry transient reads within bounded limits. Hold uncertain sends, calls and bookings for reconciliation; isolate a failing optional component so independent authorized work can continue. Never turn a missing measurement into zero or a queued action into a completed result.

Operational ownership

Dot responsibilities cover access, lead quality, delivery, video, intake/booking and management. They are assignments within configured workers and scheduled supervision, not evidence of six continuously running independent agents. Critical stops and relevant failures use the owner-alert policy; ordinary reporting remains in operational records and ChatGPT.

Built capability versus verified operation

Branch	Configuration observed	Remaining proof / limitation
Relist / DFWHomeRelaunch intake	Active form-verification, journal, consent and confirmation/call paths; saved-form recovery exists.	Fresh complete submission, owner alert, reply and booking test remains outstanding.
Relist email	Active personalized-only invitation sender; 8 p.m. close published. Full series preserved for authorized follow-up/tests.	Do not equate this sender with automatic full-series opt-in enrollment. Verify each intended enrollment path.
FSBO	Active form, consented Sarah follow-up, callback and booking workflows. Series sender inactive.	Previously reported booking errors need current execution review; full new test not performed here.
Buyer Plan / Carrollton Insider	Active inquiry pipelines; consent/no-consent routing, Sheets and confirmation/call components.	Current live public-form-to-owner outcome not tested in this review.
Foreclosure help	Website/media assets and staged durable intake, sending, suppression and reporting components.	Durable worker gates held. A separate legacy capture definition is enabled; complete production path still needs verification.
Investor	Separate assistant and isolated intake/event/suppression records; review workflows.	Consent intake webhook and call/booking/email dispatch held; no automatic production path claimed.
Brevo subscriber path	Provider handoff and event-worker structures present.	Native DOI/stop handoff and provider webhooks described as disabled/staged. Active workflow flag is insufficient.
Research report/audio delivery	Prepared multistage FSBO and foreclosure chains.	Schedules and live actions held; exact-version approval and delivery path not proven.
YouTube / City Insider	Existing queues, scheduled coordinators, assets and research/deployment helpers.	Each release/deploy needs its own receipt; workflow inventory does not establish tonight's publication.

What successful processing must show

Stage	Evidence needed	What is not enough
Inquiry captured	Saved live submission ID, person/property/request and source.	A page view or an enabled webhook.
Permission recorded	Saved permission text/scope and timestamp tied to the contact.	An enriched email address.
Response sent	Provider receipt for the exact recipient and action.	Prepared copy or a queued row.
Response received	Controlled mailbox observation or suitable receiving-system evidence.	Sender acceptance alone.
Human engagement	A attributable human reply or completed request.	Tracking pixel or bot/link scanner request.
Appointment booked	Matched confirmed Calendar event and notification evidence.	An offered slot or a successful monitor with zero events.
Broker handoff complete	David can see the request, contact details and next task; response reaches the requester.	A workflow green check.
Business result	Qualified conversation, kept appointment and broker-recorded outcome.	Email volume, video views or feature count.

End-to-end acceptance scenario

Use the existing authorized David/Maritza tests. Each participant receives the invitation, opens the intended page and personally submits a request. Trace the saved inquiry and consent, the participant response, David's alert and his reply. If an appointment is requested, verify the Calendar event and requester confirmation. Keep these tests out of new-lead and campaign-performance totals.

Traffic is a separate workstream

A working processing platform can handle demand supplied by ads, organic video, referrals or direct mail. Acquisition must be evaluated by attributable qualified inquiries and cost; processing must be evaluated by capture, response, handoff and recovery. Neither should be represented as proof of the other.

Principal workflows and evidence sources

The November 17 review enumerated 231 workflow definitions and 36 data tables. Many definitions are historical one-time tests, asset-specific jobs or inactive drafts; they are not 231 independent live business capabilities. Ten principal intake/booking/AI definitions were inspected at node level. The active sender was also verified during the preceding window update.

Relist intake | XRFhDlWY06h6116a

FSBO form and confirmation | DLB3OJ5u8XCp2G33

Seller Success pipeline | n87dx1Z8sFlCP5PA

Sarah FSBO follow-up | tx3PxvVFC1lLkxFt

Shared booking monitor | 9pEC9xhq3N6Dz3NU

Legacy clean lead processor | dUJ7e9YIvje7HUzP

Legacy Vapi intake | 9jFM1nVRCni8r4tW

AI task router | AVUN2MxR49GdghkL

Buyer Plan intake | pgHkWT6P9XbGHrcJ

Carrollton Insider intake | omMvmpl5U2w9gYEi

Relist sender | SwDMgOYTNauYxrwv

FSBO booking confirmation | JE8FtnTFr0J8qUmy

Mailbox monitor | 42zoD9KXK4BQzHW3

Owner action alerts | VVWfR2JuENCiUIhE

Evidence boundary

Status is based on live workflow metadata, selected node definitions, data-table inventory and the current operating instructions. Historical outcomes in saved descriptions were not rerun. This document is an architecture and feature reference, not a certification of end-to-end readiness. Credentials, private test recipient addresses and raw lead records are intentionally omitted.

Scope of adjacent services

GlockApps is a placement-diagnostic pilot, not established continuous monitoring. Warmforge, Warmup Inbox and Mailforge are historical outbound support services, not core inquiry processing; cancellation requests do not prove billing cancellation. Simpli.fi and paid advertising were discussed as external acquisition options, not verified live integrations. Follow Up Boss/CRM nodes are disabled where documented; no active external CRM synchronization is claimed. TubeBuddy was referenced as an auxiliary tool, not verified orchestration.

APPENDIX A

Workflow register

Complete inventory of definitions observed

Enabled indicates the n8n active flag only. Disabled internal dispatch gates can still exist inside an enabled definition. Inactive may mean a completed one-time task, manual utility, held draft or retired experiment. Names are retained for traceability; historical names do not define the platform's current product positioning.
